

1. A particle moving on the curve $\gamma(t) = (3t^2, -\sin t, -e^t)$ is released at time $t = \frac{1}{2}$ and flies off on a tangent. What are its coordinates at time $t = 1$.

Calculate the direction of the tangent.

$$\begin{aligned}\gamma'(t) &= (3(2t), -\cos(t), -e^t) = (6t, -\cos(t), -e^t) \\ \gamma'\left(\frac{1}{2}\right) &= \left(3, -\cos\left(\frac{1}{2}\right), -\sqrt{e}\right)\end{aligned}$$

Calculate the position of the particle at $t = \frac{1}{2}$.

$$\gamma\left(\frac{1}{2}\right) = \left(3\left(\frac{1}{4}\right), -\sin\left(\frac{1}{2}\right), -\sqrt{e}\right) = \left(\frac{3}{4}, -\sin\left(\frac{1}{2}\right), -\sqrt{e}\right)$$

This means the particle should be at position $\gamma\left(\frac{1}{2}\right) + \frac{1}{2}\gamma'\left(\frac{1}{2}\right)$ which is equal to:

$$\begin{aligned}&\left(\frac{3}{4}, -\sin\left(\frac{1}{2}\right), -\sqrt{e}\right) + \frac{1}{2}\left(3, -\cos\left(\frac{1}{2}\right), -\sqrt{e}\right) \\ &= \left(\frac{9}{4}, -\frac{2\sin(\frac{1}{2}) + \cos(\frac{1}{2})}{2}, -\frac{3\sqrt{e}}{2}\right)\end{aligned}$$

2. The displacement at time t and horizontal position on a line x of a certain violin string is given by $u = \sin(x - 6t) + \sin(x + 6t)$. Calculate the velocity of the string at $x = 1$ when $t = \frac{1}{3}$.

At time $t = \frac{1}{3}$, the displacement function is given by

$$u = \sin(x - 3) + \sin(x + 3)$$

Taking the rate of change we get

$$\frac{\partial u}{\partial x} = \cos(x - 3) + \cos(x + 3)$$

So the velocity is $\cos(-2) + \cos(4)$

3. Find paths $\gamma(t)$ which represent

(a) the straight line segment in \mathbb{R} from (1,2,3) to (4,-5,6).

We want γ_1 to range over 1 to 4, so we can take $\gamma_1(t) = t + 1$ over $0 \leq t \leq 3$

We want γ_2 to range over 2 to -5, so we can take $\gamma_2(t) = -\frac{7t}{3} + 2$ over $0 \leq t \leq 3$ to get $-7(3)/3 + 2 = -7 + 2 = -5$.

We want γ_3 to range over 3 to 6, so we can take $\gamma_3(t) = t + 3$ over $0 \leq t \leq 3$

$$\gamma(t) = \left(t + 1, 2 - \frac{7t}{3}, t + 3\right), 0 \leq t \leq 3$$

(b) the curve $\{(x, y) \in \mathbb{R}^2 | 3x^2 + 25y^2 = 4\}$

This is an ellipse, so x, y should be sin cos, exploiting the fact that $\sin^2 \alpha + \cos^2 \alpha = 1$ take the coefficients of the trig functions so that they cancel the existing ones. $\frac{1}{\sqrt{3}}$ and $\frac{1}{5}$ respectively. But this means the equation equals to 1, to make it 4, multiply each x, y by $\sqrt{4}$ so when it is squared, a factor of four comes out.

$$\gamma(t) = \left(\frac{2}{\sqrt{3}} \sin(t), \frac{2}{5} \cos(t)\right), 0 \leq t \leq 2\pi$$

(c) the curve of intersection of the cone $z = \sqrt{x^2 + y^2}$ and the sphere $x^2 + y^2 + z^2 = 2x$.

To actually get the intersection, equate the two parameterizations plugging z of the cone into the sphere.

$$\begin{aligned} x^2 + y^2 + x^2 + y^2 &= 2x \\ 2x^2 - 2x + 2y^2 &= 0 \\ 2\left(x^2 - x + \frac{1}{4}\right) - \frac{1}{2} + 2y^2 &= 0 \\ 2\left(x^2 - x + \frac{1}{4}\right) + 2y^2 &= \frac{1}{2} \\ 2\left(x - \frac{1}{2}\right)^2 + 2y^2 &= \frac{1}{2} \end{aligned}$$

From this ellipse equation, looking at the shift of the center of the ellipse and the constant factors, x, y should be set to $\frac{\sin(t)+1}{2}, \frac{\cos(t)}{2}$. $\gamma(t) = \left(\frac{\sin(t)+1}{2}, \frac{\cos(t)}{2}, \frac{\sin(t)+1}{2}\right), 0 \leq t \leq 2\pi$

Find the arclength of the following curves.

$$1. \quad \gamma(t) = \left(t, \frac{1}{\sqrt{2}}t^2, \frac{1}{3}t^3\right) \text{ between the origin and } \left(2, 2\sqrt{2}, \frac{8}{3}\right).$$

$$\begin{aligned}\gamma'(t) &= (1, \sqrt{2}t, t^2) \\ \|\gamma'(t)\| &= \sqrt{1 + 2t^2 + t^4} \\ &= \sqrt{(t^2 + 1)^2} \\ &= (t^2 + 1)\end{aligned}$$

$$\begin{aligned}\int_{\gamma} ds &= \int_0^2 \|\gamma'(t)\| dt \\ &= \int_0^2 t^2 dt + \int_0^2 1 dt \\ &= \frac{8}{3} + 2 \\ &= 4 + \frac{2}{3}\end{aligned}$$

$$2. \quad \gamma(t) = (\cos 3t, \sin 3t, 2t^{\frac{3}{2}}), \quad 0 \leq t \leq 2.$$

$$3. \quad \gamma(t) = (t^2, \sin t - t \cos t, \cos t + t \sin t), \quad 0 \leq t \leq \pi$$

Find the average value of the following functions over the helix $\gamma(t) = (\sin t, \cos t, t)$, $0 \leq t \leq 2\pi$.

$$\begin{aligned}\gamma'(t) &= (\cos t, -\sin t, 1) \\ \|\gamma'(t)\| &= \sqrt{\sin^2 t + \cos^2 t + 1} \\ &= \sqrt{2}\end{aligned}$$

The length of the curve γ is:
