MATB42: Assignment #8

- 1. A surface S is obtained by rotation the given figure in the xy-plane about the z-axis. (The arc is part of a circle of radius 1 centered at (2,0).)
 - (a) Paratemetrize S (in pieces) and compute the surface area.

We have that the upper line when rotated, can be parametrized by a restricted cone and similarly for the bottom. The top and bottom respectively can be written as

$$\begin{aligned} & \Phi(u,\theta) = ((1-u)3\cos\theta, (1-u)3\sin\theta, 3u), \ 0 \le u \le 1, \ 0 \le \theta \le 2\pi \\ & \Phi(u,\theta) = ((1+u)3\cos\theta, (1+u)3\sin\theta, -3u), \ -1 \le u \le 0, \ 0 \le \theta \le 2\pi \end{aligned}$$

For the circular portion to the left, when rotated around, it will be the inner half of a torus, so the equation will be

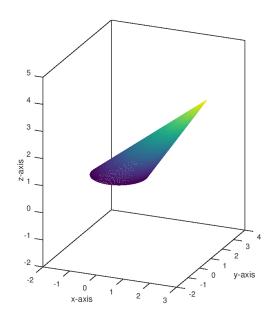

(b) Use a computer algebra system to sketch S.

- 2. Let S be the cone with vertex (2,3,3) and base the circle $x^2 + y^2 = 1$ in the xy-plane.
 - (a) Paratemetrize S

Starting with a base of a circle, we get $(\cos \theta, \sin \theta, 1)$ with $0 \le \theta \le 2\pi$. To change into a cone multiply x and y by (1-u) with $0 \le u \le 1$ and finally to shift the vertex, add (2u, 3u, 2u) where z = 2u since the base equation already has a 1, so $1 + ku <= 3 \implies k \le 2$.

$$\implies$$
 $\Phi(u,\theta) = ((1-u)\cos\theta + 2u, (1-u)\sin\theta + 3u, 1+2u)$

(b) Use a computer algebra system to sketch S.

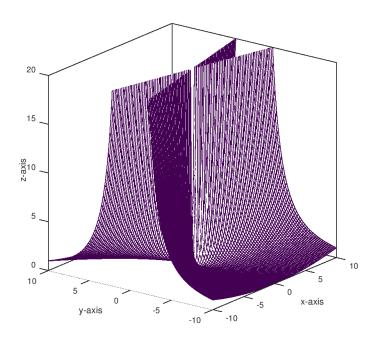

(c) Write down the integral that would give the surface area of S. (You are not expected to evaluate the integral.)

$$\begin{split} \phi_{\theta} &= (-(1-u)\sin\theta,\,(1-u)\cos\theta,\,0)\\ \phi_{u} &= (-\cos\theta+2,\,-\sin\theta+3,\,2)\\ \phi_{\theta} \times \phi_{u} &= ((2(1-u)\cos\theta),\,(2(1-u)\sin\theta),\\ &- (-(1-u)\sin\theta)(-\sin\theta+3) - ((1-u)\cos\theta)(-\cos\theta+2))\\ &= ((2-2u)\cos\theta,\,(2-2u)\sin\theta,\,(1-u)\sin^{2}\theta-(3-3u)\sin\theta+(1-u)\cos^{2}\theta-(2-2u)\cos\theta)\\ &= ((2-2u)\cos\theta,\,(2-2u)\sin\theta,\,(1-u)-(3-3u)\sin\theta-(2-2u)\cos\theta)\\ \|\phi_{\theta} \times \phi_{u}\| &= \sqrt{(2-2u)^{2}\cos^{2}\theta+(2-2u)^{2}\sin^{2}\theta+((1-u)-(3-3u)\sin\theta-(2-2u)\cos\theta)^{2}}\\ &= \sqrt{(2-2u)+((1-u)-(3-3u)\sin\theta-(2-2u)\cos\theta)^{2}}\\ \Longrightarrow \mathcal{A}(S) &= \int_{0}^{1}\int_{0}^{2\pi}\sqrt{(2-2u)+((1-u)-(3-3u)\sin\theta-(2-2u)\cos\theta)^{2}}\,d\theta\,du \end{split}$$

- 3. Let S be the self-intersecting rectangle in \mathbb{R}^3 given by the implicit equation $x^2 y^2z = 0$.
 - (a) Give a parametrization of S and use a computer algebra system to provide a sketch.

$$x^{2} - y^{2}z = 0 \implies y^{2}z = x^{2} \implies z = \left(\frac{x}{y}\right)^{2}$$

$$\Phi(x,y) = \left(x, y, \left(\frac{x}{y}\right)^{2}\right)$$

(b) Is your parametrization one-to-one? Explain.

Yes, if $\Phi(x_0, y_0) = \Phi(x_1, y_1)$ then $\Phi_1(x_0, y_0) = \Phi_2(x_1, y_1) \implies x_0 = x_1$, and $\Phi_2(x_0, y_0) = \Phi_2(x_1, y_1) \implies y_0 = y_1$. This means that $\Phi(x_0, y_0) = \Phi(x_1, y_1) \implies (x_0, y_0) = (x_1, y_1)$ so it is one to one.

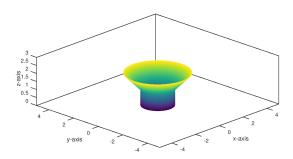

(c) Find the equation of the tangent plane to S at $\left(\frac{1}{4}, \frac{1}{2}, \frac{1}{4}\right)$.

$$\begin{split} \phi_x &= \left(1,0,\frac{2x}{y^2}\right), \ \phi_y = \left(0,1,\frac{-2x^2}{y^3}\right) \\ \phi_x \times \phi_y &= \left(\frac{-2x}{y^2},\frac{2x^2}{y^3},1\right) \\ (\phi_x \times \phi_y) \left(\frac{1}{4},\frac{1}{2}\right) &= \left(\frac{-1/2}{1/4},\frac{1/8}{1/8},1\right) \\ &= (-2,1,1) \end{split}$$

So the tangent plane is defined by the equation

$$(-2)(x-1/4) + (y-1/2) + (z-1/4) = 0 \Leftrightarrow -2x + y + z = 1/4$$

- 4. Let S be the surface defined by $x^2 + y^2 = 1$ for $0 \le z \le 1$ and by $x^2 + y^2 = z^2$ for $1 \le z \le 2$.
 - (a) Use symbolic algebra software to sketch S.

(b) Evaluate $\int_S \boldsymbol{F} \cdot d\boldsymbol{S}$ where $\boldsymbol{F}(x,y,z) = (-y,x,z)$ and S is oriented by outward pointing normals. S can be parametrized piecewise by $\boldsymbol{\Phi}_1(u,\theta) = (\cos\theta,\sin\theta,u)$ for $0 \le u \le 1$ and $\boldsymbol{\Phi}_2(u,\theta) = (u\cos\theta,u\sin\theta,u)$ for $1 \le u \le 2$ The derivatives of each are

$$\begin{split} \phi_{1_u} &= (0,0,1) \\ \phi_{2_u} &= (\cos\theta,\sin\theta,1) \end{split} \qquad \begin{aligned} \phi_{1_\theta} &= (-\sin\theta,\cos\theta,0) \\ \phi_{2_\theta} &= (-u\sin\theta,u\cos\theta,0) \end{aligned}$$

So their respective normals are

$$\phi_{1_u} \times \phi_{1_{\theta}} = (-\cos\theta, -\sin\theta, 0)$$
 $\phi_{2_u} \times \phi_{2_{\theta}} = (-u\cos\theta, -u\sin\theta, u)$

Examining the rightmost point (If projected into the xy-plane), where $\theta = 0$, both vectors will point towards the left as $-\cos(0) = -1$ (since u > 0). These normals are orientation reversing, so their integrals will need to be of the opposite sign.

$$\int_{S} \mathbf{F} d\mathbf{S} = \int_{\mathbf{\Phi}_{1}} \mathbf{F}(\mathbf{\Phi}_{1}) \cdot d\mathbf{S} + \int_{\mathbf{\Phi}_{2}} \mathbf{F}(\mathbf{\Phi}_{2}) \cdot d\mathbf{S}$$

$$\int_{\mathbf{\Phi}_{1}} \mathbf{F}(\mathbf{\Phi}_{1}) \cdot d\mathbf{S} = -\int_{0}^{1} \int_{0}^{2\pi} -(\sin\theta)(-\cos\theta) + (\cos\theta)(-\sin\theta) + (u)(0) d\theta du = 0$$

$$\int_{\mathbf{\Phi}_{2}} \mathbf{F}(\mathbf{\Phi}_{2}) \cdot d\mathbf{S} = -\int_{0}^{1} \int_{0}^{2\pi} -(u\sin\theta)(-u\cos\theta) + (u\cos\theta)(-u\sin\theta) + (u)(u) d\theta du$$

$$= -\int_{0}^{1} \int_{0}^{2\pi} u^{2} d\theta du = -\frac{2\pi}{3}$$

- 5. Evaluate the (vector) surface integral $\int_S {m F} \cdot d{m S}$ in each of the following cases.
 - (a) F(x, y, z) = (1, x, z), S is the upper hemisphere $x^2 + y^2 + z^2 = 1$, $z \ge 0$, with \boldsymbol{n} pointing upward. A parametrization for S is given by $\Phi(\theta, \varphi) = (\cos \theta \sin \varphi, \sin \theta \sin \varphi, \cos \varphi)$, where $0 \le \theta \le 2\pi$ and $0 \le \varphi \le \frac{\pi}{2}$

$$\begin{split} \boldsymbol{\phi}_{\theta} &= (-\sin\theta\sin\varphi,\cos\theta\sin\varphi,0) \\ \boldsymbol{\phi}_{\varphi} &= (\cos\theta\cos\varphi,\sin\theta\cos\varphi,-\sin\varphi) \\ \boldsymbol{\phi}_{\theta} &\times \boldsymbol{\phi}_{\varphi} &= (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin^{2}\theta\sin\varphi\cos\varphi-\cos^{2}\theta\sin\varphi\cos\varphi) \\ &= (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin\varphi\cos\varphi) \end{split}$$

Since $\sin \varphi, \cos \varphi \ge 0$ for $\varphi \in [0, \pi/2]$ this normal is orientation reversing, the sign needs to be flipped.

$$\int_{S} \mathbf{F} \cdot d\mathbf{S} = \int_{0}^{2\pi} \int_{0}^{\frac{\pi}{2}} (1, \cos\theta \sin\varphi, \cos\varphi) \cdot (\cos\theta \sin^{2}\varphi, \sin\theta \sin^{2}\varphi, \sin\varphi \cos\varphi) \, d\varphi \, d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{\frac{\pi}{2}} \cos\theta \sin^{2}\varphi + (\cos\theta \sin\varphi) (\sin\theta \sin^{2}\varphi) + (\cos\varphi) (\sin\varphi \cos\varphi)) \, d\varphi \, d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{\frac{\pi}{2}} \cos\theta \sin^{2}\varphi + \cos\theta \sin\theta \sin^{3}\varphi + \sin\varphi \cos^{2}\varphi \, d\varphi \, d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{\frac{\pi}{2}} \cos\theta \sin^{2}\varphi + \frac{1}{2}\sin(2\theta) \sin^{3}\varphi \, d\varphi \, d\theta + \int_{0}^{2\pi} \int_{0}^{\frac{\pi}{2}} \sin\varphi \cos^{2}\varphi \, d\varphi \, d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{\frac{\pi}{2}} \sin\varphi \cos^{2}\varphi \, d\varphi \, d\theta \text{ [Integrate over full period of } \theta]$$
Let $u = \cos\varphi$, $du = -\sin\varphi$

$$= \int_{0}^{2\pi} - \int_{1}^{0} u^{2} \, d\varphi \, d\theta$$

$$= 2\pi \int_{0}^{1} u^{2} \, d\varphi = \frac{2\pi}{3}$$

(b) F(x, y, z) = (2, x, z + y), S is that part of the plane x + y + z = 1 which lies in the first octant and n points upward.

Parametrize S as
$$\Phi(x,y) = (x,y,1-x-y)$$
 where $x \in [0,1], y \in [0,1-x]$

$$\phi_x = (1,0,-1), \ \phi_y = (0,1,-1), \ \phi_x \times \phi_y = (1,1,1)$$

z is positive for n, so it is orientation preserving.

$$\int_{S} \mathbf{F} \cdot d\mathbf{S} = \int_{0}^{1} \int_{0}^{1-x} (2, x, (1-x-y) + y) \cdot (1, 1, 1) \, dy \, dx$$

$$= \int_{0}^{1} \int_{0}^{1-x} 2 + x + 1 - x \, dy \, dx = \int_{0}^{1} \int_{0}^{1-x} 3 \, dy \, dx$$

$$= \int_{0}^{1} 3(1-x) \, dx = \int_{0}^{1} 3 - 3x \, dx$$

$$= 3 - \frac{3}{2} = \frac{3}{2}$$

(c) Marsden & Tromba, page 425, #22.

Let S be the part of the cone $z^2 = x^2 + y^2$ with z between 1 and 2 oriented by the normal pointing out of the cone. Compute $\iint_S \mathbf{F} \cdot d\mathbf{S}$, where $\mathbf{F}(x,y,z) = (x^2,y^2,z^2)$.

The parametrization for S is given by $\Phi(z,\theta) = (z\cos\theta, z\sin\theta, z), z \in [1,2], \theta \in [0,2\pi]$

$$\phi_z = (\cos \theta, \sin \theta, 1), \ \phi_\theta = (-z \sin \theta, z \cos \theta, 0), \ \phi_z \times \phi_\theta = (-z \cos \theta, -z \sin \theta, z)$$

Since x, y are negative, the normal vector points inwards, this is an orientation reversing normal, so the sign needs to be flipped.

$$\int_{S} \mathbf{F} \cdot d\mathbf{S} = -\int_{0}^{2\pi} \int_{1}^{2} (z^{2} \cos^{2} \theta, z^{2} \sin^{2} \theta, z^{2}) \cdot (-z \cos \theta, -z \sin \theta, z) \, dz \, d\theta$$

$$= \int_{0}^{2\pi} \int_{1}^{2} z^{3} \cos^{3} \theta + z^{3} \sin^{3} \theta - z^{3} \, dz \, d\theta$$

$$= (16/4 - 1/4) \int_{0}^{2\pi} (\cos^{3} \theta + \sin^{3} \theta - 1) \, d\theta$$

$$= \frac{15}{4} \left[\int_{0}^{2\pi} \cos \theta (1 - \sin^{2} \theta) \, d\theta + \int_{0}^{2\pi} \sin \theta (1 - \cos^{2} \theta) \, d\theta + \int_{0}^{2\pi} -1 \, d\theta \right]$$

$$= \frac{15}{4} \left[\int_{0}^{0} (1 - u^{2}) \, du - \int_{1}^{1} (1 - u^{2}) \, du + \int_{0}^{2\pi} -1 \, d\theta \right]$$

$$= -\frac{15\pi}{2}$$

- 6. Let S be the portion of the plane x 2y + z = 1 that is cut off by the coordinate planes and the plane x + y = 1. Let \mathbf{V} be the velocity field $\mathbf{V}(x, y, z) = (y, z, x^2)$. Find the flow across S when \mathbf{n} points upward. Explain your answer.
- 7. Let S be the closed surface that consists of the hemisphere $x^2 + y^2 + z^2 = 1$, $z \ge 0$, and its base $x^2 + y^2 \le 1$, z = 0. let E be the electric field E(x, y, z) = (2x, 2y, 2z). Directly calculate the electric flux across S.
