## MATB42: Assignment #7

1. (a) Find an equation of the tangent plane to the surface S defined parametrically by  $\Phi(u,v) = (u^2 + v, v, u + v^2)$  at the point (9,0,3).

$$v = 0 \qquad \qquad u + v^2 = 3 \implies u = 3$$
 
$$\phi_u = (2(3), 0, 1)$$
 
$$\phi_v = (1, 1, 2(0))$$
 
$$\phi_u \times \phi_v = (-1, 1, 6)$$

So the tangent plane can be given by

$$0 = ((x - 9, y, z - 3) \cdot (-1, 1, 6))$$
  

$$0 = (9 - x + y + 6z - 18)$$
  

$$9 = -x + y + 6z$$

(b) Use symbolic algebra software to sketch the surface S and its tangent plane from part (a).

- 2. Use a surface integral to find the area of the triangle in  $\mathbb{R}^3$  with vertices (1,1,0), (1,2,1) and (3,3,2).
- 3. Calculate the surface area of the piece of the cone  $x^2 + y^2 z^2 = 0$  which lies inside the cylinder  $x^2 + y^2 = 4$ .

We can see the radius of the cylinder is 2, so the cone portion that's cut out is the part which has radius less than or equal to  $2 \implies 0 \le z \le 2$ . Using polar for the cone,  $0 \le \theta \le 2\pi$ .

$$\begin{split} & \Phi(\theta,z) = (z\cos\theta,z\sin\theta,z) \\ & \phi_{\theta} = (-z\sin\theta,z\cos\theta,0) \\ & \phi_{z} = (\cos\theta,\sin\theta,1) \\ & \phi_{\theta} \times \phi_{z} = (z\cos\theta,z\sin\theta,-z\sin^{2}\theta-z\cos^{2}\theta) \\ & = (z\cos\theta,z\sin\theta,-z) \\ & \|\phi_{\theta} \times \phi_{z}\| = z^{2}\cos^{2}\theta+z^{2}\sin^{2}\theta+z^{2}=2z^{2} \end{split}$$

4. (a) Find the area of the portion of the unit sphere that is cut out by the cone  $z = \sqrt{x^2 + y^2}$ . (cf. page 391, #10)

$$\begin{split} & \Phi_{\mathrm{sphere}}(\theta,\varphi) = (\cos\theta\sin\varphi,\sin\theta\sin\varphi,\cos\varphi) \\ & \phi_{\theta} = (-\sin\theta\sin\varphi,\cos\theta\sin\varphi,0) \\ & \phi_{\varphi} = (\cos\theta\cos\varphi,\sin\theta\cos\varphi,-\sin\varphi) \\ & \phi_{\theta} \times \phi_{\varphi} = (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin^{2}\theta\sin\varphi\cos\varphi-\cos^{2}\theta\sin\varphi\cos\varphi) \\ & = (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin\varphi\cos\varphi) \\ & = (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin\varphi\cos\varphi) \\ & \|\phi_{\theta} \times \phi_{\varphi}\| = \sqrt{\cos^{2}\theta\sin^{4}\varphi+\sin^{2}\theta\sin^{4}\varphi+\sin^{2}\varphi\cos^{2}\varphi} \\ & = \sqrt{\sin^{2}\varphi} = \sin\varphi \end{split}$$

$$\Phi_{\text{cone}}(\theta, z) = (z \cos \theta, z \sin \theta, z)$$

$$\phi_z = (\cos \theta, \sin \theta, 1)$$

$$\phi_\theta = (-z \sin \theta, z \cos \theta, 0)$$

$$\phi_z \times \phi_\theta = (-z \cos \theta, -z \sin \theta, z)$$

$$\|\phi_z \times \phi_\theta\| = 2z^2$$

For the unit sphere  $x^2+y^2+z^2=1$ , but the cone is  $x^2+y^2=z^2 \Longrightarrow \text{sub } z$  into sphere gives  $2x^2+2y^2=1$  So the exact intersection of the surfaces is a circle of radius  $2/\sqrt{2}$  centered at the origin, so the surface cut out is the section of the top of the sphere where  $z\geq 2\sqrt{2} \Longrightarrow \varphi\leq \frac{\pi}{4}$  from the  $z=\cos\varphi$  portion of the parametrization. So the ranges are  $0\leq\theta\leq 2\pi$ ,  $0\leq\varphi\leq\frac{\pi}{4}$ . The area is therefore

$$\int_0^{2\pi} \int_0^{\frac{\pi}{4}} \sin\varphi \, d\varphi \, d\theta = \int_0^{2\pi} \left[ -\cos\varphi \right]_0^{\frac{\pi}{4}}$$

(b) Find the area of the portion of the cone  $z=\sqrt{x^2+y^2}$  that is cut out by the unit sphere. Plugging in  $x^2+y^2=1/2$  to the cone equation again gives  $z^2=1/2 \implies z=\pm \frac{\sqrt{2}}{2}$  but  $z\geq 0$  by the cone definition so  $0\leq z\leq \frac{\sqrt{2}}{2}$ .

$$A(\Phi_{\rm cone}) = \int_{0}^{2\pi} \int_{0}^{\frac{1}{4}}$$

5. Let  $\Phi: D \subset \mathbb{R}^2 \to \mathbb{R}^3$  be a parametrization of a 2-dim surface S in  $\mathbb{R}^3$ .

(a) Set

$$E = \|\phi_u\|^2, \qquad F = \phi_u \cdot \phi_v, \qquad G = \|\phi_v\|^2,$$

Show that the surface area of S is

$$A(S) = \iint_{D} \sqrt{EG - F^2} \, dA$$

$$\begin{split} \iint_D \sqrt{EG - F^2} \, dA &= \iint_D \sqrt{\|\phi_u\|^2 \|\phi_v\|^2 - (\phi_u \cdot \phi_v)^2} \, dA \\ &= \iint_D \sqrt{(\|\phi_u\| \|\phi_v\|)^2 - (\|\phi_u\| \|\phi_v\|)^2 \cos^2 \theta} \, dA \quad \text{Where } \theta \text{ is the angle between } \phi_u \text{ and } \phi_v. \\ &= \iint_D \sqrt{(\|\phi_u\| \|\phi_v\|)^2 (1 - \cos^2 \theta)} \, dA \\ &= \iint_D \sqrt{(\|\phi_u\| \|\phi_v\|)^2 (\sin^2 \theta)} \, dA \\ &= \iint_D \sqrt{\|\phi_u \times \phi_v\|^2} \, dA \\ &= \iint_D \|\phi_u \times \phi_v\| \, dA \\ &= \iint_D \|\phi_u \times \phi_v\| \, dA \\ &= \iint_D \|\phi_u \times \phi_v\| \, dA \end{split}$$

(b) What does the formula for A(S) become if the vectors  $\phi_u$  and  $\phi_v$  are orthogonal? If the vectors are orthogonal, then the dot product is 0, so the equation reduces to

$$A(S) = \iint_D \|\phi_u\| \|\phi_v\| \, dA$$

(c) Use parts (a) and (b) to compute the surface area of a sphere of radius a. (cf. Marsden & Tromba, page 399, # 23.)

$$\begin{split} & \Phi(\theta,\varphi) = a(\cos\theta\sin\varphi,\sin\theta\sin\varphi,\cos\varphi) \\ & \phi_\theta = a(-\sin\theta\sin\varphi,\cos\theta\sin\varphi,0) \\ & \phi_\varphi = a(\cos\theta\cos\varphi,\sin\theta\cos\varphi,-\sin\varphi) \\ & \|\phi_\theta\| = a\sin\varphi, \quad \|\phi_\varphi\| = a \\ \Longrightarrow & A(S) = a^2 \int_0^{2\pi} \int_0^\pi \sin\varphi \, d\varphi \, d\theta \\ & = a^2 \int_0^{2\pi} \left[ -\cos\varphi \right]_0^\pi \, d\varphi \, d\theta \\ & = a^2 \int_0^{2\pi} -(-1-1) \, d\varphi \, d\theta \\ & = a^2 2 \int_0^{2\pi} 1 \, d\varphi \, d\theta \\ & = 4\pi a^2 \end{split}$$

6. For each of the following surfaces S, sketch S (using symbolic software) and evaluate the surface integral  $\int_S f \, dS$ , where f(x, y, z) = x.

(a) S is that part of the surface  $y = 4 - x^2$  between z = 0 and z = 1, with  $y \ge 0$ .

$$y \geq 0 \implies 4 - x^2 \geq 0 \implies x^2 \leq 4 \implies |x| < 2$$

$$\begin{split} & \Phi(x,z) = (x,4-x^2,z) \\ & \phi_x = (1,-2x,0), \ \phi_z = (0,0,1) \\ & \phi_x \times \phi_z = (-2x,-1,0) \implies \|\phi_x \times \phi_z\| = \sqrt{4x^2+1} \\ & \int_S f dS = \int_0^1 \int_{-2}^2 x \sqrt{4x^2+1} \, dx \, dz \end{split}$$

The integrand is odd since x odd and  $\sqrt{4x^2 + 1}$  even, so the integral over x is 0, making the entire integral 0.

(b) S is the upper half of the unit sphere centered at the origin.

Only the upper half so  $0 \le \theta \le 2\pi$  and  $0 \le \varphi \le \pi/2$ .

$$\begin{split} & \Phi(\theta,\varphi) = (\cos\theta\sin\varphi,\sin\theta\sin\varphi,\cos\varphi) \\ & \phi_{\theta} = (-\sin\theta\sin\varphi,\cos\theta\sin\varphi,0) \\ & \phi_{\varphi} = (\cos\theta\cos\varphi,\sin\theta\cos\varphi,-\sin\varphi) \\ & \phi_{\theta} \times \phi_{\varphi} = (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin^{2}\theta\sin\varphi\cos\varphi-\cos^{2}\theta\sin\varphi\cos\varphi) \\ & = (-\cos\theta\sin^{2}\varphi,-\sin\theta\sin^{2}\varphi,-\sin\varphi\cos\varphi) \\ & \|\phi_{\theta} \times \phi_{\varphi}\| = \sqrt{\cos^{2}\theta\sin^{4}\varphi+\sin^{2}\theta\sin^{4}\varphi+\sin^{2}\varphi\cos^{2}\varphi} \\ & = \sqrt{\sin^{4}\varphi+\sin^{2}\varphi\cos^{2}\varphi} \\ & = \sqrt{\sin^{2}\varphi} = \sin\varphi \\ & \int_{\Phi} f \, dS = \int_{0}^{\frac{\pi}{2}} \int_{0}^{2\pi} \cos\theta\sin^{2}\varphi \, d\theta \, d\varphi = 0 \end{split}$$

The integral is zero again since integrating  $\cos \theta$  over a whole period is 0.

(c) S is that part of the surface  $x = \sin y$  with  $0 \le y \le \pi$  and  $0 \le z \le 2$ .

$$\begin{split} & \Phi(y,z) = (\sin y, y, z) \\ & \phi_y = (\cos y, 1, 0) \\ & \phi_z = (0, 0, 1) \\ & \phi_y \times \phi_z = (1, -\cos y, 0) \\ & \|\phi_y \times \phi_z\| = \sqrt{1 + \cos^2 y} \\ & \int_{\Phi} f \, dS = \int_0^2 \int_0^{\pi} \sin y \sqrt{1 + \cos^2 y} \, dy \, dz \end{split}$$

7. Find the mass of the metallic surface S given by  $z = 1 - \frac{x^2 + y^2}{2}$  with  $0 \le x \le 1$ ,  $0 \le y \le 1$ , if the mass density at  $(x, y, z) \in S$  is given by m(x, y, z) = xy.
