1. Let
$$f(x) = \begin{cases} 0, & -\pi < x < -\frac{\pi}{2} \\ 2, & -\frac{\pi}{2} \le 2 < \frac{\pi}{2} \\ 0, & \frac{\pi}{2} \le x < \pi \end{cases}$$

(a) Find the Fourier series of f.

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{-\frac{\pi}{2}} 0 dx + \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} 2 dx + \int_{\frac{\pi}{2}}^{\pi} 0 dx \right]$$

$$= \frac{1}{\pi} \left[2\pi \right]$$

$$= 2$$

$$b_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin(kx) dx$$
$$= \frac{2}{\pi} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sin(kx) dx$$
$$= 0 \quad [\sin \text{ is odd}]$$

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos(kx) dx$$

$$= \frac{2}{\pi} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos(kx) dx$$

$$= \frac{2}{k\pi} \left[\sin(kx) \right]_{-\frac{\pi}{2}}^{\frac{\pi}{2}}$$

$$= \frac{2}{k\pi} \left[2 \sin\left(\frac{k\pi}{2}\right) \right]$$

$$= \frac{4}{k\pi} \sin\left(\frac{k\pi}{2}\right)$$

This is 0 for even elements, and alternating between 1 and -1 for odd elements.

Therefore the Fourier polynomial (for the non-zero terms) is

$$1 + \sum_{l=1}^{\infty} \left[\frac{4(-1)^l}{(2l+1)\pi} \cos((2l+1)x) \right]$$

- (b) Determine if the Fourier series in part (a) converges. If it does converge, what are the values to which it converges (on $[-\pi, \pi]$).
 - The function is continuous on its partitions (they are constant functions), so by the theorem the polynomial converges to f(x) on the continuous intervals. On the discontinuities, it converges to 0 at $\frac{\pi}{2}$ and $\frac{-\pi}{2}$ from the Fundamental theorem, and to 0 at π and $-\pi$.
- (c) Use symbolic algebra software to sketch f(x) and its 4^{th} degree Fourier polynomial over the interval $[-3\pi, 3\pi]$.

2. (a) Find the Fourier series of the function f(x) defined by $f(x) = \begin{cases} 0 & , -\pi \le x < 0 \\ x & , 0 \le x < \pi \end{cases}$ and extended from this with period 2π to all of \mathbb{R} .

If this Fourier series converges describe the function to which it converges.

$$a_{0} = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} f(x) dx + \int_{0}^{\pi} f(x) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} f(x) dx + \int_{0}^{\pi} f(x) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \sin(kx) dx \right]$$

$$= \frac{1}{\pi} \left[\frac{1}{2} \left[x^{2} \right]_{0}^{\pi} \right]$$

$$= \frac{\pi}{2}$$

$$a_{k} = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos(kx) dx$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \cos(kx) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \cos(kx) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \cos(kx) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \cos(kx) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \cos(kx) dx \right]$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{0} 0 dx + \int_{0}^{\pi} x \cos(kx) dx \right]$$
Therefore the Fourier series of f is
$$f(x) = \frac{\pi}{4} + \sum_{k=1}^{\infty} \left[\frac{(-1)^{k} - 1}{k^{2}\pi} \cos(kx) + \frac{(-1)^{k+1}}{k} \sin(kx) \right]$$

$$= -\frac{1}{k\pi} \left[\int_{0}^{\pi} \sin(kx) dx \right]$$

Since f is piecewise very smooth (0, x are infinitely differentiable), the series converges to f on $(-\pi, \pi)$ and on both endpoints, it converges to $\frac{\pi}{2}$.

(b) Using the series from part (a) show that

 $= \frac{1}{k^2 \pi} \Big[\cos(kx) \Big]_0^{\pi}$

 $=\frac{(-1)^{-k}-1}{k^2\pi}$

$$\frac{\pi^2}{8} = 1 + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \cdots$$

$$F(0) = \frac{\pi}{4} + \sum_{k=1}^{\infty} \left[\frac{(-1)^k - 1}{k^2 \pi} \right]$$

$$\frac{\pi}{4} = \sum_{k=1}^{\infty} \left[\frac{2}{(2k-1)^2 \pi} \right]$$

$$\frac{\pi^2}{8} = \sum_{k=1}^{\infty} \frac{1}{(2k-1)^2}$$

- 3. Find the Fourier series for the restriction of the function f(x) = 3+3x to each of the following intervals, [a,b]. If the Fourier series converges, to what values will the series converge at the end points?
 - (a) $[a, b] = [-\pi, \pi]$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$
$$= \frac{1}{\pi} \int_{-\pi}^{\pi} 3 + 3x dx$$
$$= \frac{1}{\pi} \left[6\pi + \frac{3}{2} \left[x^2 \right]_{-\pi}^{\pi} \right]$$
$$= \frac{1}{\pi} \left[6\pi + 0 \right]$$
$$= 6$$

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos(kx) dx$$

$$= \frac{1}{\pi} \left[3 \int_{-\pi}^{\pi} \cos(kx) dx + \int_{-\pi}^{\pi} x \cos(kx) dx \right]$$

$$= \frac{6}{k\pi} \left[\sin(kx) \right]_{0}^{\pi}$$
 [Since x odd and \cos even]
$$= 0$$

$$b_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin(kx) dx$$

$$= \frac{3}{\pi} \left[\int_{-\pi}^{\pi} \sin(kx) dx + \int_{-\pi}^{\pi} x \sin(kx) dx \right]$$

$$= \frac{6}{\pi} \left[\int_{0}^{\pi} x \sin(kx) dx \right]$$
 [Since x and x and

Linear functions are infinitely differentiable so it will converge to f(x) within the interval, and coverges to 3 at the endpoints.

 $=\frac{6(-1)^{k+1}}{k}$

(b)
$$[a, b] = [0, 2\pi]$$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$

$$= \frac{1}{\pi} \int_{0}^{2\pi} 3 + 3x dx$$

$$= \frac{1}{\pi} \left[6\pi + \frac{3}{2} \left[x^2 \right]_{0}^{2\pi} \right]$$

$$= \frac{1}{\pi} \left[6\pi + 6\pi^2 \right]$$

$$= 6(\pi + 1)$$

$$a_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos(kx) dx$$

= $\frac{1}{\pi} \left[3 \int_{0}^{2\pi} \cos(kx) dx + \int_{0}^{2\pi} x \cos(kx) dx \right]$

Let
$$u = x$$
, $du = dx$, $dv = \cos(kx)$, $v = \frac{\pi}{k} \sin(kx)$

$$= \frac{6}{k\pi} \left[\left[\sin(kx) \right]_0^{2\pi} + \left[x \sin(kx) 2\pi_0 - \int dx \right] \right]$$

$$b_k = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin(kx) dx$$

$$= \frac{3}{\pi} \left[\int_{-\pi}^{\pi} \sin(kx) dx + \int_{-\pi}^{\pi} x \sin(kx) dx \right]$$

$$= \frac{6}{\pi} \left[\int_{0}^{\pi} x \sin(kx) dx \right]$$
 [Since x and \sin odd]

Let $u = x, du = 1 dx, dv = \sin(kx) dx, v = -\frac{\cos(kx)}{k}$

$$= \frac{6}{\pi} \left[-\frac{1}{k} \left[x \cos(kx) \right]_{0}^{\pi} + \frac{1}{k} \int_{0}^{\pi} \cos(kx) dx \right]$$

$$= \frac{6}{k\pi} \left[\pi (-1)^{k+1} + \frac{1}{k} \left[\sin(kx) \right]_{0}^{\pi} \right]$$

$$= \frac{6(-1)^{k+1}}{k}$$

Let u = x, du = dx, $dv = \cos(kx)$, $v = \frac{1}{k}\sin(kx)$ Linear functions are infinitely differentiable so it will converge to f(x) within the interval, and coverges to $3 + 3\pi$ at the endpoints.

- 4. Find the Fourier series for the restriction of the function $f(x) = x(x 2\pi)$ and extended from this with period 2π to all of \mathbb{R} . Use symbolic algebra software to graph the 4^{th} degree Fourier polynomial together with the original function.
- 5. Let f(x) be defined on $[0, 2\pi]$ by $f(x) = x(x 2\pi)$.
 - (a) Find the Fourier cosine series of f.
 - (b) Find the Fourier sine series of f.
 - (c) Use symbolic algebra software to graph the 4^th degree Fourier polynomials from parts (a) and (b) together with the original function.
- 6. Find the Fourier series for the following functions:

(a)
$$f(x) = \sin^2 x + \sin^3 x$$

(b)
$$f(x) = \sin^4 x$$

(c)
$$f(x) = \cos^7 x$$

(*Hint*: Recall that
$$\cos \theta = \frac{e^{i\theta} + e^{-i\theta}}{2}$$
 and $\sin \theta = \frac{e^{i\theta} + e^{-i\theta}}{2i}$)

The next question is for those among you who have previously seen complex numbers. It gives another approach to Fourier series.

- 7. Suppose
 - i. f(x) is a real values function of x,

ii.
$$f(x) = \sum_{n=-\infty}^{\infty} C_n einx$$
 on $[-\pi, \pi]$, where the C_n are complex constants, and

- iii. that the term by term theorem holds true in this case
- (a) Express the C_n as integrals involving f.
- (b) Find the Fourier coefficients of f in terms of the C_n .
- (c) Find the C_n in terms of the Fourier coefficients of f.
