## MATB42: Assignment #10

- 1. Let  $\mathbf{F}$  be a vector field on  $\mathbb{R}^3$  given by  $\mathbf{F} = (F_1, F_2, F_3)$  where  $F_1, F_2$ , and  $F_3$  are  $C^1$ -functions from  $\mathbb{R}^3 \to \mathbb{R}$ 
  - (a) Let  $\eta$  be the 2-form given by

$$\eta = F_3 dx dy + F_1 dy dz + F_2 dz dx$$

Show that  $d\eta = (\operatorname{div} \mathbf{F}) dx dy dz$  (page 489, #6)

$$\begin{split} \eta &= F_3 \, dx \, dy + F_1 \, dy \, dz + F_2 \, dz \, dx \\ d\eta &= d(F_3 \, dx \, dy + F_1 \, dy \, dz + F_2 \, dz \, dx) \\ &= (dF_3) \, dx \, dy + (dF_1) \, dy \, dz + (dF_2) \, dz \, dx \\ &= (\frac{\partial}{\partial x} F_3 \, dx + \frac{\partial}{\partial y} F_3 \, dy + \frac{\partial}{\partial z} F_3 \, dz) \, dx \, dy + (dF_1) \, dy \, dz + (dF_2) \, dz \, dx \\ &= \frac{\partial}{\partial z} F_3 \, dz \, dx \, dy + (dF_1) \, dy \, dz + (dF_2) \, dz \, dx \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + (\frac{\partial}{\partial x} F_1 \, dx + \frac{\partial}{\partial y} F_1 \, dy + \frac{\partial}{\partial z} F_1 \, dz) \, dy \, dz + (dF_2) \, dz \, dx \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + (dF_2) \, dz \, dx \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + (\partial^2_{z} F_2 \, dx + \frac{\partial}{\partial y} F_2 \, dy + \frac{\partial}{\partial z} F_2 \, dz) \, dz \, dx \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + (\frac{\partial}{\partial y} F_2 \, dy \, dz \, dx \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial z} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_1 \, dx \, dy \, dz + \frac{\partial}{\partial y} F_2 \, dx \, dy \, dz \\ &= \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}{\partial x} F_3 \, dx \, dy \, dz + \frac{\partial}$$

(b) Show that  $dF_1 \wedge dF_2 \wedge dF_3 = (\det D\mathbf{F}) dx dy dz$ 

$$df = \sum_{i=0}^{n} \frac{\partial f}{\partial x_i} \, dx_i$$

$$\begin{split} dF_1 \wedge dF_2 \wedge dF_3 &= \left(\frac{\partial F_1}{\partial x} \, dx + \frac{\partial F_1}{\partial y} \, dy + \frac{\partial F_1}{\partial z} \, dz\right) \wedge \left(\frac{\partial F_2}{\partial x} \, dx + \frac{\partial F_2}{\partial y} \, dy + \frac{\partial F_2}{\partial z} \, dz\right) \\ &= \left(\frac{\partial F_1}{\partial x} \, dx \wedge \left(\frac{\partial F_2}{\partial x} \, dx + \frac{\partial F_2}{\partial y} \, dy + \frac{\partial F_2}{\partial z} \, dz\right) \\ &+ \frac{\partial F_1}{\partial y} \, dy \wedge \left(\frac{\partial F_2}{\partial x} \, dx + \frac{\partial F_2}{\partial y} \, dy + \frac{\partial F_2}{\partial z} \, dz\right) \\ &+ \frac{\partial F_1}{\partial z} \, dz \wedge \left(\frac{\partial F_2}{\partial x} \, dx + \frac{\partial F_2}{\partial y} \, dy + \frac{\partial F_2}{\partial z} \, dz\right) \\ &+ \frac{\partial F_1}{\partial z} \, dz \wedge \left(\frac{\partial F_2}{\partial x} \, dx + \frac{\partial F_2}{\partial y} \, dy + \frac{\partial F_2}{\partial z} \, dz\right) \right) \wedge dF_3 \\ &= \left(\left(\frac{\partial F_1}{\partial x} \frac{\partial F_2}{\partial x} \, dx \, dy + \frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} \, dx \, dz\right) \\ &+ \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial x} \, dz \, dx + \frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} \, dy \, dz\right) \\ &+ \left(\frac{\partial F_1}{\partial x} \frac{\partial F_2}{\partial y} - \frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial x} \, dx \, dy\right) \\ &+ \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial y} \, dx \, dy\right) \\ &+ \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dz \, dx\right) \right) \wedge \left(\frac{\partial F_3}{\partial x} \, dx + \frac{\partial F_3}{\partial y} \, dy + \frac{\partial F_3}{\partial z} \, dz\right) \\ &= \left(\frac{\partial F_3}{\partial z} \left(\frac{\partial F_1}{\partial x} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy\right) dz\right) \\ &+ \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy \, dz\right) \\ &+ \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy \, dz\right) \\ &+ \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy \, dz\right) \\ &+ \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy \, dz\right) \\ &+ \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy \, dz\right) \\ &+ \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \, dx \, dy \, dz\right) \\ &= \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} - \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z} \right) dx \, dy \, dz$$
 \\ &= \frac{\partial F\_3}{\partial x} \left(\frac{\partial F\_1}{\partial y} \frac{\partial F\_2}{\partial z} - \frac{\partial F\_1}{\partial z} \frac{\partial F\_2}{\partial z} - \frac{\partial F\_1}{\partial z} \frac{\partial F\_2}{\partial z}\right) dx \, dy \, dz 
$$&= \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z} \frac{\partial F_1}{\partial z} \frac{\partial F_2}{\partial z}\right) dx \, dy \, dz$$
 
$$&= \frac{\partial F_3}{\partial x} \left(\frac{\partial F_1}{\partial y} \frac{\partial F_2}{\partial z}$$

2. Let  $\omega$  be a k-form and let  $\eta$  be a  $\ell$ -form. Find  $d(d\omega \wedge \eta - \omega \wedge d\eta)$ .

$$\begin{split} d(d\omega \wedge \eta - \omega \wedge d\eta) &= d(d\omega \wedge \eta) - d(\omega \wedge d\eta) \\ &= (d^2\omega \wedge \eta + (-1)^{k+1}(d\omega \wedge d\eta)) - (d\omega \wedge d\eta + (-1)^k(\omega \wedge d^2\eta)) \\ &= (-1)^{k+1}d\omega \wedge d\eta - d\omega \wedge d\eta \\ &= ((-1)^{k+1} - 1)d\omega \wedge d\eta \end{split}$$

3. Determine if  $\eta = y \, dx \, dy + xz \, dy \, dz - yz \, dz \, dx$  is exact. If  $\eta$  is exact find a 1-form  $\omega$  with  $d\omega = \eta$ . Check if  $d\eta = \mathcal{O}$  to see if  $\eta$  closed.

(compare with page 461, # 22)

$$\begin{split} d\eta &= d(y \, dx \, dy + xz \, dy \, dz - yz \, dz \, dx) \\ &= (dy \, dx \, dy + d(xz) \wedge dy \, dz - d(yz) \wedge dz \, dx) \\ &= ((z \, dx + x \, dz) \wedge dy \, dz - (z \, dy + y \, dz) \wedge dz \, dx) \\ &= (z \, dx) \wedge dy \, dz - (z \, dy) \wedge dz \, dx \\ &= z \, dx \, dy \, dz - z \, dx \, dy \, dz = \mathcal{O} \end{split}$$

Since the polynomials of x, y and z defined throughout  $\mathbb{R}^3$  and  $\eta$  closed, it is exact. By inspection,

$$\omega = xy\,dy + xyz\,dz$$

4. Evaluate  $\iint_S \omega$ , where  $\omega = z \, dx \, dy + x \, dy \, dz + y \, dz \, dx$  and S is the unit sphere, directly and by the Divergence Theorem.

(page 489, #12)

Directly:

Parametrize the sphere S as

$$\Phi(\varphi,\theta) = (\cos\theta\sin\varphi,\sin\theta\sin\varphi,\cos\varphi)$$
 with  $\theta \in [0,2\pi], \, \varphi \in [0,\pi]$ 

$$\begin{split} \iint_{S} \omega &= \iint_{\Phi} z \, dx \, dy + \iint_{\Phi} x \, dy \, dz + \iint_{\Phi} y \, dz \, dx \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \cos \varphi \, \left| \frac{\partial \cos \theta \sin \varphi}{\partial \sin \theta \sin \varphi} - \frac{\partial \cos \theta \sin \varphi}{\partial \sin \theta \sin \varphi} \right| \, d\varphi \, d\theta + \int_{0}^{2\pi} \int_{0}^{\pi} \cos \theta \sin \varphi \, \left| \frac{\partial \sin \theta \sin \varphi}{\partial \varphi} - \frac{\partial \sin \theta \sin \varphi}{\partial \varphi} \right| \, d\varphi \, d\theta \\ &+ \int_{0}^{2\pi} \int_{0}^{\pi} \sin \theta \sin \varphi \, \left| \frac{\partial \cos \theta \sin \varphi}{\partial \varphi} - \frac{\partial \cos \varphi}{\partial \varphi} - \frac{\partial \cos \varphi}{\partial \varphi} \right| \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \cos \varphi \, \left| \frac{\cos \theta \cos \varphi}{\sin \theta} - \sin \varphi \right| \, d\varphi \, d\theta + \int_{0}^{2\pi} \int_{0}^{\pi} \cos \theta \sin \varphi \, \left| \frac{\sin \theta \cos \varphi}{\partial \varphi} - \cos \theta \sin \varphi \right| \, d\varphi \, d\theta \\ &+ \int_{0}^{2\pi} \int_{0}^{\pi} \sin \theta \sin \varphi \, \left| \frac{-\sin \varphi}{\cos \theta \cos \varphi} - \sin \theta \sin \varphi \right| \, d\varphi \, d\theta + \int_{0}^{2\pi} \int_{0}^{\pi} \cos \theta \sin \varphi \, \left| \sin \theta \cos \varphi - \cos \theta \sin \varphi \right| \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \sin \theta \sin \varphi \, \left| \frac{-\sin \varphi}{\cos \theta \cos \varphi} - \sin \theta \sin \varphi \right| \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \sin \varphi \cos^{2} \varphi \, d\varphi \, d\theta + \int_{0}^{2\pi} \int_{0}^{\pi} \cos^{2} \theta \sin^{3} \varphi + \sin^{2} \theta \sin^{3} \varphi \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \sin \varphi \cos^{2} \varphi \, d\varphi \, d\theta + \int_{0}^{2\pi} \int_{0}^{\pi} \cos^{2} \theta \sin^{3} \varphi + \sin^{2} \theta \sin^{3} \varphi \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \sin \varphi \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \sin \varphi \, d\varphi \, d\theta \\ &= \int_{0}^{2\pi} \int_{0}^{\pi} \sin \varphi \, d\varphi \, d\theta \\ &= 2\pi \bigg[ -\cos \varphi \bigg]_{0}^{\pi} = 2\pi \end{split}$$

Divergence Theorem:

$$d\omega = dz \, dy \, dx + dx \, dy \, dz + dy dz dx = 3 \, dx \, dy \, dz$$

$$\iint_{S} \omega = \iiint_{R} d\omega$$

$$= 3 \int_{0}^{2\pi} \int_{0}^{\pi} \int_{0}^{1} \rho^{2} \sin(\varphi) \, d\rho \, d\varphi \, d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{\pi} \sin(\varphi) \, d\varphi \, d\theta$$

$$= 2\pi \left[ -\cos\varphi \right]_{0}^{\pi} = 2\pi$$

- 5. Compute  $\int_{S} \omega$  and use symbolic algebra software to sketch S in each of the following.
  - (a)  $\omega = xz \, dx \, dy + x^2 \, dy \, dz + dy \, dz \, dx$ S is the upper hemisphere  $x^2 + y^2 + z^2 = 4$ ,  $z \ge 0$  with n pointing upward.

Close it with the disk of radius 2 on the xy-plane to apply divergence theorem

$$\mathbf{\Phi}(\theta, r) = (r\cos\theta, r\sin\theta, 0), \ r \in [0, 2], \ \theta \in [0, 2\pi]$$

$$dx dy = \begin{vmatrix} -r\sin\theta & \cos\theta \\ r\cos\theta & \sin\theta \end{vmatrix} = -2r$$

Which is negative, so correct orientation for normal pointing down.

$$dy dz = 0$$
 Since z is 0

$$dz dx = 0$$

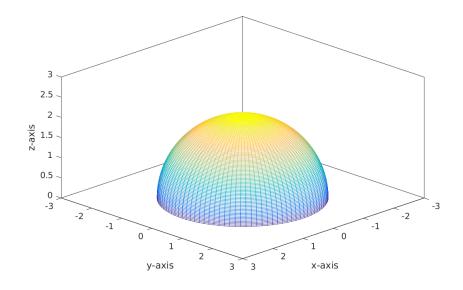

$$\overset{\text{Div Thm}}{\Longrightarrow} \iint_S \omega = \iiint_R d\omega - \iint_{\Phi} \omega$$
 But  $z = 0 \implies xz \, dx \, dy = 0 \implies \iint_{\Phi} \omega = 0$ 

$$d\omega = x \, dx \, dy \, dz + 2x \, dx \, dy \, dz = 3x \, dx \, dy \, dz$$

$$\begin{split} \iiint_R d\omega &= \int_0^2 \int_0^{2\pi} \int_0^{\frac{\pi}{2}} 3(\rho \sin \varphi \cos \theta) \rho^2 \sin \varphi \, d\varphi \, d\theta \, d\rho \\ &= 0 \text{ Since integrating cos over full period} \end{split}$$

$$=0$$
 Since integrating cos over full period

$$\implies \int_{S} \omega = 0$$

## (b) $\omega = z dx dy + x dy dz + y dz dx$

S is the part of the plane x + y + z = 1 which lies in the first octant oriented by the unit normal which points upward.

Use the natural parametrization for S:

$$\mathbf{\Phi}(x,y) = (x,y,1-x-y), \ x \in [0,1], \ y \in [0,1-x]$$

$$\begin{aligned} dx \, dy &= \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} > 0 \, \forall x, y \implies \text{ Correct orientation} \\ \int_S \omega &= \int_0^1 \int_0^{1-x} (1-x-y) + x \begin{vmatrix} 0 & 1 \\ -1 & -1 \end{vmatrix} + y \begin{vmatrix} -1 & -1 \\ 1 & 0 \end{vmatrix} \, dy \, dx \\ &= \int_0^1 \int_0^{1-x} 1 \, dy \, dx = \int_0^1 1 - x \, dx \\ &= 1 - \frac{1}{2} = \frac{1}{2} \end{aligned}$$

(c)  $\omega = xz \, dx \, dy + y \, dx \, dz + z^2 \, dy \, dz$ 

S is the part of the cone  $z=\sqrt{x^2+y^2}$  between z=1 and z=3, oriented by the unit normal with negative z-component.

$$\Phi(\theta, r) = (r\cos\theta, r\sin\theta, r), \ r \in [1, 3], \ \theta \in [0, 2\pi]$$

$$dx \, dy = \begin{vmatrix} -r\sin\theta & \cos\theta \\ r\cos\theta & \sin\theta \end{vmatrix} = -r < 0 \text{ for } r > 1$$

$$dy \, dz = \begin{vmatrix} r\cos\theta & \sin\theta \\ 0 & 1 \end{vmatrix} = r\cos\theta$$

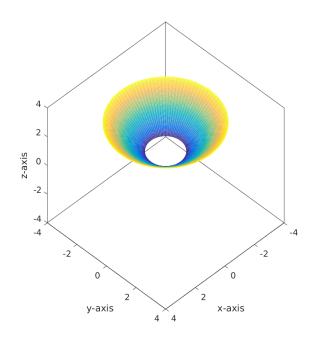

$$dz \, dx = \begin{vmatrix} 0 & 1 \\ -r\sin\theta & \cos\theta \end{vmatrix} = r\sin\theta$$

$$\implies \omega = (r\cos\theta)(r)(-r) - (r\sin\theta)(r\sin\theta) + (r)^2(r\cos\theta)$$

$$= -r^2\sin^2\theta = -r^2\left(\frac{1}{2} - \frac{\cos(2\theta)}{2}\right)$$

$$\implies \int_S \omega = \int_1^3 \int_0^{2\pi} -r^2\left(\frac{1}{2} - \frac{\cos(2\theta)}{2}\right) d\theta \, dr$$

$$= \int_1^3 -r^2\pi \, dr = -\pi \left[\frac{r^3}{3}\right]_1^3 = -\frac{26\pi}{3}$$

(d)  $\omega = z dx dy + y dy dz$ 

S is the oriented surface given by the parametrization

$$\Phi(u,v) = (u+v, uv^2, u^2+v^2), \ 0 \le u \le 1, \ 0 \le v \le 1.$$

$$dx dy = \begin{vmatrix} 1 & 1 \\ v^2 & 2uv \end{vmatrix} = 2uv - v^2, \ dy dz = \begin{vmatrix} v^2 & 2uv \\ 2u & 2v \end{vmatrix} = 2v^3 - 4u^2v$$

$$\begin{split} \iint_S \omega &= \int_0^1 \int_0^1 (u^2 + v^2)(2uv - v^2) + (uv^2)(2v^3 - 4u^2v) \, du \, dv \\ &= \int_0^1 \int_0^1 (2u^3v - u^2v^2) + (2uv^3 - v^4) + (2uv^5 - 4u^3v^3) \, du \, dv \\ &= \int_0^1 \frac{v}{2} - \frac{v^2}{3} + v^3 - v^4 + v^5 - v^3 \, du \, dv \\ &= \int_0^1 \frac{v}{2} - \frac{v^2}{3} - v^4 + v^5 \, du \, dv \\ &= \frac{1}{4} - \frac{1}{9} - \frac{1}{5} + \frac{1}{6} = \frac{19}{180} \end{split}$$

6. Verify Stokes' theorem by direct calculation of both sides when the surface S is the piece of the paraboloid  $z = x^2 + y^2 - 4$  with  $z \le 0$ , oriented by the downward pointing unit normal, and  $\omega = (2y - z) dx + (x + y^2 - z) dy + (4y - 3x) dz$ .

As part of your solution, provide a sketch showing the appropriate orientations. (For this question you may draw the sketch by hand or use symbolic algebra software.)

Stokess' Theorem states that:

$$\int_{\partial S} \omega = \int_{S} d\omega$$

Calculation of  $\int_{\partial_S} \omega$ 

The boundary curve of the plane is the circle at z=0 with radius 2. Since the normal vector is downward pointing, the curve is parametrized clockwise. So parametrize the curve as  $\gamma(\theta) = (-2\cos\theta, 2\sin\theta, 0)$ 

$$\int_0^{2\pi} (2(2\sin\theta) - 0)(2\sin\theta) + ((-2\cos\theta) + (2\sin\theta)^2 - 0)(2\cos\theta) \, d\theta$$

$$= \int_0^{2\pi} 8\sin^2\theta - 4\cos^2\theta + 8\sin^2\theta\cos\theta \, d\theta$$

$$= \int_0^{2\pi} 4(1 - \cos(2\theta)) - 2(1 + \cos(2\theta)) + 8\sin^2\theta\cos\theta \, d\theta$$

$$= \int_0^{2\pi} 2 + 8\sin^2\theta\cos\theta \, d\theta$$

$$= 4\pi + \left[\frac{8\sin^3\theta}{3}\right]_0^{2\pi} = 4\pi$$

Calculation of  $\int_S d\omega$ 

(Using the parametrization  $\Phi(\theta, r) = (r \cos \theta, r \sin \theta, r^2 - 4), r \in [0, 2], \theta \in [0, 2\pi]$ )

$$dx \, dy = \begin{vmatrix} -r\sin\theta & \cos\theta \\ r\cos\theta & \sin\theta \end{vmatrix} = -r$$

So the orientation is in the correct direction.

$$d\omega = d(2y - z) dx + d(x + y^{2} - z) dy + d(4y - 3x) dz$$

$$= (2 dy - dz) \wedge dx + (dx - dz) \wedge dy + (4 dy - 3 dx) \wedge dz$$

$$= -2 dx dy - dz dx + dx dy + dy dz + 4 dy dz + 3 dz dx$$

$$= -dx dy + 5 dy dz + 2 dz dx$$

$$\implies \int_{S} d\omega = \int_{0}^{2\pi} \int_{0}^{2} - \begin{vmatrix} -r \sin \theta & \cos \theta \\ r \cos \theta & \sin \theta \end{vmatrix} + 5 \begin{vmatrix} r \cos \theta & \sin \theta \\ 0 & 2r \end{vmatrix} + 2 \begin{vmatrix} 0 & 2r \\ -r \sin \theta & \cos \theta \end{vmatrix} dr d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{2} r + 5(2r^{2} \cos \theta) + 2(2r^{2} \sin \theta) dr d\theta$$

$$= 2\pi \int_{0}^{2} r dr = 4\pi$$
